

**REVERSE FOREIGN KEY TECHNIQUES IN WEBSITE  
DEVELOPMENT**

**ABSTRACT**

A computer-implemented method for automatically presenting relationship  
5 information between a first table and a second table of a database. The method  
includes ascertaining an existence of a first foreign key relationship between the  
first table and the second table. If the first foreign key relationship between the  
first table and the second table exists, automatically generating first executable  
codes to obtain, for a first given record in the first table, a first number of records  
10 in the second table that references the first given record. When the first given  
record is displayed in a view, the method includes also displaying the first number  
of records in the second table that references the first given record .
